NC DWQ Stream Identification Form Version 4.11 Cameron Run 02-STR-07

		<u> </u>	
Date: November 2, 2015	Project/Site: DC2RVA - Area 02	Latitude: 38.805758	
Evaluator: L. Eggering, W. Moorhead	County: Fairfax	Longitude: -77.108206	
Total Points: 47 Stream is at least intermittent if ≥ 19 or perennial if ≥ 30*	Stream Determination (circle one) Ephemeral Intermittent (Perennial)	Other e.g. Quad Name:	

A. Geomorphology (Subtotal = 25)	Absent	Weak	Moderate	Strong
1 <sup>a.</sup> Continuity of channel bed and bank	0	1	2	(3)
2. Sinuosity of channel along thalweg	0	1	2	(3)
3. In-channel structure: ex. riffle-pool, step-pool,	0	1	2	3
ripple-pool sequence				
4. Particle size of stream substrate	0	1	2	(3)
5. Active/relict floodplain	0	(1)	2	3
6. Depositional bars or benches	0	1	2	3
7. Recent alluvial deposits	0	1	2	(3)
8. Headcuts	0	1	2	3
9. Grade control	0	0.5	1	(1.5)
10. Natural valley	0	0.5	1	(1.5)
11. Second or greater order channel	N <sub>1</sub>	0 = 0	Yes:	(3)
artificial ditches are not rated; see discussions in manual				
B. Hydrology (Subtotal = 9)	1	Г	T	
12. Presence of Baseflow	0	1	2	3
13. Iron oxidizing bacteria	0	1	2	3
14. Leaf litter	1.5	1	0.5	0
15. Sediment on plants or debris	0	0.5	1	1.5
16. Organic debris lines or piles	0	0.5	1	(1.5)
17. Soil-based evidence of high water table?	N	o = 0	Yes:	€3)
C. Biology (Subtotal = 13				
18. Fibrous roots in streambed	(3)	2	1	0
19. Rooted upland plants in streambed	(3)	2	1	0
20. Macrobenthos (note diversity and abundance)	0	1	(2)	3
21. Aquatic Mollusks	0	1	(2)	3
22. Fish	0	0.5	(1)	1.5
23. Crayfish	0)	0.5	1	1.5
24. Amphibians	0	0.5	(1)	1.5
25. Algae	0	0.5	(1)	1.5
26. Wetland plants in streambed		FACW = 0.75;	OBL = 1.5 Other € 0	
*perennial streams may also be identified using other methods	. See p. 35 of manua	al.

	Very little incision or active erosion; 80 100% stable banks. Vegetative surface protection or natural rock, prominent (80-100%). AND/OR Stable point bars/bankfull benches are present. Access to their original floodplain or fully developed wide bankfull benches. Mid-channel bars, and transverse bars few. Transient sediment deposition covers less than 10% of bottom.		7% stable banks. Vegetative ace protection or natural rock, minent (80-100%). AND/OR le point bars/bankfull benches resent. Access to their original dplain or fully developed wide ull benches. Mid-channel bars, transverse bars few. Transient ent deposition covers less than 10% of bottom.		Erosion may be present on 40-60% of both banks. Vegetative protection on 40-60% of banks. Streambanks may bevertical or underout. AND/OR 40- 60% of stream is covered by sediment. Sediment may be temporary/transient, contribute instability. Deposition that contribute to stability, may be forming/present. AND/OR V-shaped channels have		widen further. Majority of both banks are near vertical. Erosion present on 60-80% of banks. Vegetative protection present on 20-40% of banks, and is insufficient to prevent erosion. AND/OR 60-80% of the stream is covered by sediment. Sediment is temporary/transient in		beeply incised (of accorated), vertical/lateral instability. Severe incision, flow contained within the banks. Streambed below average rooting depth, majority of banks vertical/undercut. Vegetative protection present on less than 20% of banks, is not preventing erosion. Obvious bank sloughing present.  Erosion/raw banks on 80-100%.  AND/OR Aggrading channel. Greater than 80% of stream bed is covered by

NC DWQ Stream Identification Form Version 4.11

02-STR-71

Date: 10/12/2015	Project/Site: DC2RVA - Area 02	Latitude: 38.405344
Evaluator: D. Mitchell, M. Rockwell	County: Stafford	Longitude: -77.364625
Total Points: 19 Stream is at least intermittent if ≥ 19 or perennial if ≥ 30*	Stream Determination (circle one) Ephemera Intermittent Perennial	Other e.g. Quad Name:

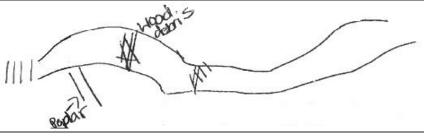

A. Geomorphology (Subtotal = 9.5)	Absent	Weak	Moderate	Strong
1 <sup>a.</sup> Continuity of channel bed and bank	0	(1)	2	3
2. Sinuosity of channel along thalweg	0	(1)	2	3
In-channel structure: ex. riffle-pool, step-pool, ripple-pool sequence	0	1	2	3
4. Particle size of stream substrate	0	(1)	2	3
5. Active/relict floodplain	0	0	2	3
6. Depositional bars or benches	0	<b>(</b> 1 <b>)</b>	2	3
7. Recent alluvial deposits	0	1	2	3
8. Headcuts	0	1	2	3
9. Grade control	0	0.5	1	1.5
10. Natural valley	0	0.5	1)	1.5
11. Second or greater order channel	No	= 0	Yes	= 3
a artificial ditches are not rated; see discussions in manual				
B. Hydrology (Subtotal = 3.5				
12. Presence of Baseflow	0	1	2	3
13. Iron oxidizing bacteria	0	(1)	2	3
14. Leaf litter	1.5	<b>(1)</b>	0.5	0
15. Sediment on plants or debris	0	0.5	1	1.5
16. Organic debris lines or piles	0	0.5		1.5
17. Soil-based evidence of high water table?	(No	= 0	Yes	= 3

_				
C. Biology (Subtotal = 6				
18. Fibrous roots in streambed	3	(2)	1	0
19. Rooted upland plants in streambed	3	2	1	0
20. Macrobenthos (note diversity and abundance)	0		2	3
21. Aquatic Mollusks	0	7	2	3
22. Fish	(0)	0.5	1	1.5
23. Crayfish	0	0.5	1	1.5
24. Amphibians	0	0.5	1	1.5
25. Algae	0	0.5	1	1.5
26. Wetland plants in streambed		FACW = 0.75; C	OBL = 1.5 Other = 0	

\*perennial streams may also be identified using other methods. See p. 35 of manual.

Notes: 24" culvert. Large mature beech & tulip poplar trees present along bank. Paw-paw present. Stream has sections where it goes underground, and then reappears. Field Sheet 06-STR-03.

Optimal			Suboptimal		Conditional Category  Marginal		Poor		Severe	
	Very little incision or active erosion; 80 100% stable banks. Vegetative		Slightly incised, few areas of active		Often incised, but less than Severe or Poor. Banks more stable than Severe or Poor due to lower bank slopes. Erosion may be present on 40-60% of both banks. Vegetative protection on 40-60% of banks. Streambanks may bevertical or undercut. AND/OR 40-60% of stream is covered by sediment. Sediment may be temporary/transient, contribute		Overwidened/incised.  Vertically/laterally unstable. Likely to widen further. Majority of both banks are near vertical. Erosion present on 60-80% of banks. Vegetative protection present on 20-40% of banks, and is insufficient to prevent erosion. AND/OR 60-80% of the stream is covered by sediment. Sediment is temporary/transient in		Deeply incised (or excavated), vertical/lateral instability. Severe incision, flow contained within the banks. Streambed below average rooting depth, majority of banks vertical/undercut. Vegetative vertical/undercut. Vegetative protection present on less than 20% of banks, is not preventing erosion. Obvious bank sloughing present. Erosion/raw banks on 80-100%.	
Channel Condition										
			Sueam bottom.		banks and depositional features which contribute to stability.		sediment deposition is absent.		Multiple thread channels and/or subterranean flow.
