## INTRODUCTION

All Aboard Florida, LLC is proposing a new passenger rail station in the City of Miami as part of a passenger rail service linking Miami, Fort Lauderdale, and West Palm Beach. The proposed rail station is located south of NW 8<sup>th</sup> Street, north of NW 3<sup>rd</sup> Street, west of NW 1<sup>st</sup> Avenue, and east of NW 2<sup>nd</sup> Avenue. Currently, the proposed development parcel is vacant. The project includes a grade-separated All Aboard Florida (AAF) train station platform. Access to the proposed passenger rail station is provided along NW 6<sup>th</sup> Street between NW 1<sup>st</sup> Court and NW 1<sup>st</sup> Avenue and along NW 1<sup>st</sup> Avenue between NW 6<sup>th</sup> Street and NW 8<sup>th</sup> Street. Figure 1 illustrates the site's location. A site plan is provided in Appendix A.

The purpose of this traffic impact study is to assess the project's impact on the surrounding transportation network and determine if adequate capacity is available to support future demand.

This report summarizes the data collection, project trip generation and distribution, and capacity analyses.

## PROJECT TRAFFIC

Project traffic is defined as the vehicle trips expected to be generated by the project, and the distribution and assignment of this traffic over the roadway network.

### Existing and Proposed Land Uses

The project site parcel is currently vacant. The proposed development consists of a grade-separated AAF train station platform.

### Project Access

The station's parking is located on-site with access along NW 6<sup>th</sup> Street between NW 1<sup>st</sup> Court and NW 1<sup>st</sup> Avenue and along NW 1<sup>st</sup> Avenue between NW 6<sup>th</sup> Street and NW 8<sup>th</sup> Street.

### Trip Generation

Trip generation calculations for the proposed passenger rail station were performed using boarding and alighting ridership data provided in the AAF ridership information. Table 1 summarizes the project's forecast trip generation for the weekday A.M. and weekday P.M. peak hours. As shown in Table 1, this project is expected to generate 340 gross trips during the A.M. and P.M. peak hours. Detailed trip generation information (including AAF ridership data) is included in Appendix B.

### ***Multimodal Reduction***

The City of Miami's Development of Regional Impact (DRI) Increment I and II provides multimodal reduction factors to be applied to certain parts of the city. For the Central Business District (CBD), an average reduction of 23 percent (23%) is recommended. It is expected that a portion of visitors to the site as well as employees will utilize transit. Miami-Dade County Transit (MDT) provides bus service via seven (7) routes in the vicinity of the site, in addition to the Metromover and Metrorail. The following transit services are provided:

- **Route 2** operates with 20 minute headways.

- **Route 21** operates with 30 minute headways.
- **Route 95 Express** operates with 10 minute headways.
- **Route 207/208** operates with 20 minute headways.
- **Route 208** operates with 15 minute headways.
- **Route 211** operates with 45 minute headways.
- **Route 243** operates with 30 minute headways.
- **Metrorail** operates with 8 minute headways.
- **Metromover** operates with 1.5 minute headways.

Detailed route information and headway data is provided in Appendix C.

#### ***Vehicle Occupancy Reduction***

The Institute of Transportation Engineers (ITE) trip generation assumes a vehicle occupancy rate of 1.2 persons per vehicle; however, the City of Miami has determined that 1.4 persons per vehicle are more appropriate for the local area. Therefore, vehicular trips were reduced by 16 percent (16.0%) to adjust for these vehicle occupancy assumptions.

#### ***Net New Trips***

Net new project trips are equal to the gross project trips minus the internal capture, multimodal reduction, vehicle occupancy reduction, and existing development trips. The net new project trips represent additional vehicles on the roadway network. As shown in Table 1, this project is expected to generate 198 net new trips during the A.M. and P.M. peak hours.

| Table 1: Trip Generation               |                            |                            |                            |                                 |                          |                            |                            |                            |                                 |                          |                           |                           |                            |

### Trip Distribution and Assignment

The likely distribution of project traffic was forecast for trips expected to be generated by the project. The trip distribution was based on a cardinal trip distribution obtained from the *2035 Cost Feasible Plan* for the area's traffic analysis zones (TAZ 515, 518, 526, 527, 528, 531, 532, and 533). The average cardinal trip distribution for all TAZ's is provided in Table 2. The detailed cardinal distribution is included in Appendix D.

**Table 2: Cardinal Trip Distribution**

| Cardinal Direction | Percentage of Trips |
|--------------------|---------------------|
| North-Northeast    | 14%                 |
| East-Northeast     | 13%                 |
| East-Southeast     | 4%                  |
| South-Southeast    | 9%                  |
| South-Southwest    | 11%                 |
| West-Southwest     | 17%                 |
| West-Northwest     | 16%                 |
| North-Northwest    | 16%                 |
| <b>Total</b>       | <b>100%</b>         |

Project trips were then distributed and assigned to the roadway network based on the likely routes by inbound and outbound traffic from the proposed development. Figures 2 and 3 show the project distribution and assignment for the A.M. and P.M. peak hours.

## EXISTING TRAFFIC

Turning movement counts for the A.M. peak period were selected from 7:30 A.M. to 9:30 A.M. based on the downtown and business district characteristics of the general area as well as input from City of Miami transportation staff. Turning movement counts for the P.M. peak period were selected from 4:00 P.M. to 6:00 P.M. Turning movement counts were collected at the following intersections:

- NW 8<sup>th</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 8<sup>th</sup> Street and NW 1<sup>st</sup> Court
- NW 8<sup>th</sup> Street and NW 1<sup>st</sup> Avenue
- NW 7<sup>th</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 7<sup>th</sup> Street and NW 1<sup>st</sup> Court
- NW 6<sup>th</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 6<sup>th</sup> Street and NW 1<sup>st</sup> Court
- NW 6<sup>th</sup> Street and NW 1<sup>st</sup> Avenue
- NW 5<sup>th</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 5<sup>th</sup> Street and NW 1<sup>st</sup> Court
- NW 5<sup>th</sup> Street and NW 1<sup>st</sup> Avenue
- NW 4<sup>th</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 3<sup>rd</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 3<sup>rd</sup> Street and NW 1<sup>st</sup> Avenue
- NW 2<sup>nd</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 1<sup>st</sup> Street and NW 2<sup>nd</sup> Avenue
- NW 1<sup>st</sup> Street and NW 1<sup>st</sup> Avenue

The volumes were collected in 15-minute intervals and the peak hour was determined for each intersection. Additionally, the Florida Department of Transportation (FDOT) peak season conversion factor for the time period when data was collected was reviewed and determined to be 1.0. As a result, the FDOT peak season conversion factor does not alter the raw turning movement counts.

The turning movement counts, FDOT peak season factory category report, and signal timing data are included in Appendix E. Figures 4 and 5 present the existing turning movement volumes at the study intersections during the A.M. and P.M. peak hours.

City of Miami, Florida

## **FUTURE BACKGROUND TRAFFIC**

Future background traffic conditions are defined as expected traffic conditions on the roadway network in the year 2016 without the construction of the development. Future background traffic volumes used in the analysis are the sum of the existing traffic and an additional amount of traffic generated by growth in the study area. Refer to Figure 5 for the year 2016 peak hour background traffic volumes during the weekday A.M. and P.M. peak hours.

### **Background Area Growth**

Future traffic growth on the transportation network was determined based upon historic growth trends, at nearby FDOT traffic count stations. The following FDOT traffic count stations were referenced for this analysis:

- FDOT count station no. 7044 located on NW 10<sup>th</sup> Street, 350 feet east of NW 3<sup>rd</sup> Avenue
- FDOT count station no. 7062 located on NW 2<sup>nd</sup> Avenue, 100 feet south of NW 8<sup>th</sup> Street

The 5-year trend analysis determined the average growth rate to be negative 7.07 percent (-7.07%). In order to provide a conservative analysis, a growth rate of 0.50 percent (0.50%) was used in the analysis. Historical traffic count data and growth trend calculations are included in Appendix F.

### **Committed Development**

Miami World Center was identified as a committed (not yet built) development and is included in the analysis. Therefore, traffic projected from this development was added to background A.M. and P.M. peak hour traffic. Corresponding traffic assignments and site plans are included in Appendix G.

- Legend**
- Study Roadway
  - Study Intersection
  - XX AM Peak Hour Traffic
  - (XX) PM Peak Hour Traffic

## **FUTURE TOTAL TRAFFIC**

Future total traffic conditions are defined as the expected traffic conditions in the year 2016 with the proposed train station operational. Total traffic volumes considered in the analysis for this project are the sum of the year 2016 background traffic volumes and the expected project traffic volumes. The peak hour future traffic volumes for the A.M. and P.M. peak hours are shown in Figure 6. Volume development worksheets for the study intersections are included in Appendix H.

- Legend**

  - Study Intersection
  - XX AM Peak Hour Traffic
  - (XX) PM Peak Hour Traffic

## INTERSECTION CAPACITY ANALYSIS

The operating conditions were analyzed for the study intersections. Three (3) scenarios (existing conditions, future background conditions, and future total conditions) were analyzed using Trafficware's *SYNCHRO 8.0* Software, which applies methodologies outlined in the Transportation Research Board's (TRB's) *Highway Capacity Manual*, 2000/2010 Edition. Synchro worksheets for the study intersections are included in Appendix I. A summary of the intersection and driveway analyses for the A.M. and P.M. peak hours is presented in Table 3. As Table 3 indicates, all study intersections are expected to operate at adopted levels of service (LOS E or better) during the A.M. and P.M. peak hours under all analysis conditions.

| Table 3: A.M. Intersection Capacity Analysis            |                           |                                            |                 |                 |                 |                 |
|---------------------------------------------------------|---------------------------|--------------------------------------------|-----------------|-----------------|-----------------|-----------------|

- (1) Overall intersection LOS is not defined, as intersection operates under stop-control conditions.
- (2) Approach operates under free-flow conditions; therefore, no level of service is provided
- (3) No results provided as intersection operates as free-flow
- (4) Due to intersection geometry, HCM 2010 can't be used. Therefore, HCM 2000 results are provided.

## CONCLUSION

This traffic impact study assessed the impacts of the proposed new passenger rail station in Miami as part of a passenger rail service linking Miami, Fort Lauderdale, and West Palm Beach. The proposed development includes a grade-separated AAF train station platform.

Trip generation calculations indicate that the project is expected to generate 198 net new vehicular trips during both the A.M. and P.M. peak hours.

Intersection capacity analyses were performed for existing conditions and for future conditions with and without project traffic. Results of the analyses demonstrate that study intersections in the vicinity of the project site operate at adopted levels of service during both the A.M. and P.M. peak hours under all analysis conditions, including existing, background (future without project), and future total (with project) conditions.

## Intersection Summary

Cycle Length: 100

Actuated Cycle Length: 100

Offset: 2 (2%), Referenced to phase 2:SBT and 6:NBTL, Start of Green

Natural Cycle: 50

Control Type: Pretimed

Splits and Phases: 20: NW 2nd Ave & NW 1st St
